

Protecting Life and Property

Control Instruments positions itself as the application specialist in industrial safety, process, and environmental gas monitoring. Since 1969, we have been engineering and manufacturing solutions to both simple and complex gas monitoring problems. Our primary mission is to protect life and property from accidents caused by hazardous gases.

Studies have shown that practically all failures (accidents) can be traced back to human failures, in three particular areas: inadequate training; improper maintenance; and improper application of equipment. Control Instruments seeks to first educate its customers in understanding gas hazards. We then assist them in selecting the appropriate equipment for each application. The industrial design of our instruments reduces maintenance and offers improved reliability in demanding industrial applications.
